

INNOVATIVE PROTECTION FOR WATER & WASTEWATER SYSTEMS

Protecting and maintaining vital water and wastewater infrastructure is crucial in today's world. Henkel offers a comprehensive range of corrosion prevention products and systems through its portfolio of trusted brands.

As industry experts, we provide protection for water infrastructure with solutions tailored to application-specific demands, ensuring durability and long-term operational efficiency. Our proven coating, wrap, and lining solutions ensure longevity for essential assets and equipment, reduce ongoing maintenance costs, and maintain consistent productivity.

Our technologies protect a variety of assets, like large-diameter transmission pipe, smaller distribution lines, manholes, and clarifier tanks – and work across materials such as ductile iron, concrete, and carbon steel, which are prone to corrosion in buried and submerged environments.

These solutions are ideal for both new installs and the rehabilitation of aging assets. By combining advanced technology with decades of expertise, we help utilities and municipalities meet regulatory requirements while improving system reliability. Ultimately, our goal is to deliver peace of mind through durable protection that keeps water flowing where it's needed most.
